Hausken has since 1992 specialised in the development of sound and recoil suppressors for hunting weapons. Norwegian quality, design, finish and precision are some of the criteria Hausken values. Correct use of sound suppressors reduces the risk of hearing injuries among hunters and working hounds, and gives the hunter a more comprehensive experience in the field.

Hausken moderators are made from high grade, hard anodised aluminum because weight is a significant factor in hunting under typical conditions. The moderator consists of two main parts, the baffles and outer casing . The baffles are machined from a solid aluminum core. The outer casing is manufactured in either aluminum or titanium, depending upon the caliber. The barrel nut is manufactured in stainless steel or aluminum depending upon the model.

This product is intended for civilian use with a given caliber and thread. Improper use and/or modification may result in personal injury and/or damage to equipment. Hausken moderators are not suitable for military use due to construction design and materials used. The product will not withstand temperature or pressure extremes that are required of military equipment.

Guarantee under normal use. Ensure the product is undamaged and is properly assembled before use. Do not allow the moderator to come into contact with flammable liquid/material. Although aluminum is a robust material, excessive use in long series is not advisable . Allow the moderator to cool down between series (10-15 shots with normal caliber). Insulating covers are not advisable with prolonged use due to heat entrapment . Hausken moderators should be fitted by a qualified gunsmith as it is crucial that the moderator center line is concentric with the barrel axis.
